

Assignment : Module 1 & 2

• Assignment 1 : Short Answer questions

1) What is the Web?

→ The 'Web' is global system of interconnected documents and resources (Webpages, images, videos) accessed via the internet using hyperlinks to navigate between them all made viewable through web browsers like chrome

2) What is the difference between the Web and the Internet?

→ * Web

A collection of information (Websites, pages) accessed via the Internet.

* Internet

The vast physical network of interconnected computers and devices.

3) What is Website? Give two examples

→ A 'www' - A collection of web pages accessible via the internet hosted on a web server, and typically identified by a unique domain name; providing information, services or interactive functionality.

ex:- Google.com, Amazon.com

What is a Web Application? Give two ex

A web application is software accessed via a web browser over the internet running on a remote server instead of being installed on your device.

ex 1. Gmail, Facebook.

What is Frontend development

The Frontend is the part of the website or application that users see and interact with directly in their browser (client side)

What is Backend development

The backend, or server-side, is the underlying technology that handles the data, logic and server operations behind the scenes making the Frontend functionality possible.

What is the role of HTML in web development

HTML (HyperText Markup Language) is the ~~fund~~ foundational backbone of all web development defining the structure and content of web pages that browsers then display.

What is the role of CSS in web development

CSS (Cascading Style Sheets) in web development is to control the presentation style, and layout of web pages.

What is the role of Bootstrap

The role of Bootstrap is to speed up Front-end web development by providing pre-written, HTML, CSS, Javascript, components and a responsive grid system.

Faster, Development, Responsive Design, consistency & standardization, pre-built, components, customization.

Name any two web browsers

~~Google Chrome~~. Google chrome, microsoft edge, opera.

Assignment 2: How browsers work

User enters a URL in the browser.

the browser first uses DNS to find the website's IP address; then establishes a TCP connection, sends an HTTP request, receives the server's HTTP response (HTML, CSS, JS) and then content to display the webpage.

Browser sends a request to the server
Browser acts as client sending an HTTP request (like GET for page or POST) over the internet using (TCP/IP) to a server to fetch resources like web pages, images or data.

3) Server sends a response

→ A server sends a response to a client in reaction to an HTTP request

4) Browser renders the webpage

→ converting HTML, CSS and JavaScript code into a visual and interactive display that a user sees on their screen.

Assignment 3: Real-Life Scenario. Online Admission System.

1) What will be included in the frontend?

→ The used for frontend HTML, CSS, ~~Java~~

2) What will be included in the backend.

→ The used for backend JavaScript, bootstrap and MySQL for database.

3) Where will HTML, CSS and Bootstrap be used

→ design and form is used in HTML and CSS and backend used Bootstrap.

Assignment 5: Meta Tags.

1) What is the use of the (Meta) tag?

→ Meta tags provide "hidden" data about data within the <head> of an HTML page.

How are meta tags useful for SEO?
 The meta tags useful for SEO is title tag, meta description and robots meta tag.

What is the difference between <title> and <meta> tags

meta keywords help search engines to find your site.

while title tags help to identify your site to visitors.

Assignment : Interview-oriented questions

Why do we use <!DOCTYPE html>

The <!DOCTYPE html> declaration is used to instruct the web browser about the version of HTML the page is written.

What is the difference between <head> and <body> tags?

- The <head> contains metadata,
- The <body> contains the visible content

Is HTML case-sensitive? Explain

HTML is generally case-insensitive this means that an element can be written using any combination of uppercase and lowercase letters and browser will interpret them the same way

How does a browser display an HTML page?
Browsers parse the HTML document
to create a document object model (DOM)
tree which is then used to render the page.
